### **[Regional cerebral angiodystonia in the practice of a neuropathologist and therapist]**

[Article in Russian]

**[Pokalev GM, Raspopina LA.](#)**

Altogether 108 patients with regional cerebral angiodystonia were examined using rheoencephalography, measurements of temporal and venous pressure and functional tests (nitroglycerin and bicycle ergometry). Three variants of abnormalities connected with regional cerebral angiodystonia were distinguished: dysfunction of the inflow, derangement of the venous outflow, and initial functional venous hypertonia. The patients were treated with nonmedicamentous therapy (electroanalgesia, magnetotherapy, iontotherapy).
