[Combined therapy of interstitial cystitis using the "Aeltis-Synchro-02-Iarilo" device]

[Article in Russian]

[Kalinina SN](#), [Molchanov AV](#), [Rutskaiia NS](#).

Multiple modality therapy of interstitial cystitis (IC)--the disease characterized by nicturia, pelvic pains, imperative pollakiuria--is considered. As IC nature is not well known, its treatment remains empiric. Among the underlying causes, most probable are autoimmune, allergic, infectious, neurological, vascular. Therefore, the treatment should be multi-modality. Most usable now is combined chemotherapy. Perspective is also IC treatment with medicines in combination with physiotherapy (electromagnetolaser AELTIS-SYNCHRO-02-YARILO"). Endovesical electrophoresis can be also applied.
